

✖ The US Fish and Wildlife Service, US Geological Survey, and a coalition of NGOs and state wildlife agencies have issued the first comprehensive report on the [State of the Birds](#) in the U.S. Of more than 800 species, 67 are federally listed under the ESA, and another 184 are considered species of conservation concern because of limited distribution, high threats, or declining populations.

The results reflect the influence of human activities and global change on our nation's birds. Every U.S. habitat harbors birds in need of conservation. Hawaiian birds and ocean birds appear most at risk, with populations in danger of collapse if immediate conservation measures are not implemented. Bird populations in grassland and aridland habitats show the most rapid declines over the past 40 years. Birds that depend on forests are also declining.

In contrast, wetland species, wintering coastal birds, and hunted waterfowl show increasing populations during the past 40 years, reflecting a strong focus during this period on wetlands conservation and management.
