This is the final installment in a series of posts about the public service activities of environmental law programs. There are a lot of law schools in this part of the country; space allows the inclusion of entries from only a few of them:

- A <u>clinic</u> that represents solar power companies, assists communities with climate change adaptation, and investigates fracking.
- A <u>website</u> that comprehensively tracks climate change litigation and regulation.
- An <u>environmental performance index</u> that measures the environmental outcomes in countries around the world.
- A <u>center</u> which convened a collaboration that seeks to reduce greenhouse gas emissions from the transportation sector across 11 states and the District of Columbia.
- A <u>clinic</u> that has worked on precedent-setting environmental crimes cases.
- An <u>institute</u> that produces white papers on the improved use of economic analysis in environmental regulation.
- A U.S.-China environmental law partnership.
- A <u>clinic</u> that represents the Riverkeeper for one of America's great rivers.
- Participation in federal notice-and-comment rule making.
- A <u>clinic</u> focusing on the areas of water quality, water rights, mining, solid waste disposal, and land use.

These four posts provide only a partial view of what law schools are doing to help address environmental law problems. The individual projects are not necessarily earthshaking stuff, but I think we can all feel some satisfaction about the cumulative impact of all of this work.
