

Although I have previously [argued](#) that we might be better off if the Trump Administration withdraws from the Paris Agreement, the odds seem higher that Trump will choose to remain in. He can appease his daughter and son-in-law, appear to be reasonable, and give up very little by remaining in. If he makes this choice, it will be fascinating to see how the administration participates in the implementation of the agreement.

What, for example, will the Administration do about the fact that it has already repudiated most of the U.S. Nationally Determined Contribution (NDC)—the U.S. pledge under the Paris Agreement to cut its emissions—submitted by the Obama Administration? Legally, can the U.S. submit a new NDC that is less ambitious than its current submission? And if it does so, how will the parties to the agreement respond under the treaty? Of course, there’s also a political question here: assuming that the U.S. submits a less ambitious NDC, what would that commitment look like and would the administration embrace the mission of the Paris Agreement in its submission?

Fundamentally, the NDC process under the agreement commits each signatory to “undertake and communicate ambitious efforts to ... achiev[e] the purpose of this Agreement....” Countries communicate their efforts through their NDCs.

The [current U.S. NDC](#) commits the U.S. to greenhouse gas emissions reductions of 26 to 28 percent below 2005 levels by 2025. Its centerpiece is the Clean Power Plan. Yet the Trump Administration has [committed](#) to withdrawing the CPP. The current NDC also includes ambitious greenhouse gas emissions standards for passenger vehicles. The Trump Administration is threatening to weaken them. The NDC includes methane reductions from oil and gas operations on public lands. Although the Senate just [refused](#) to overturn the rule, all indications are that the Trump Administration will withdraw and weaken it significantly.

Indeed, of the five central components of the U.S. NDC, the Trump Administration is

rejecting four of them in whole or in part. Only one, an important regulation that limits the uses of some hydrofluorocarbons (supported by Honeywell and Chemour, which may explain the Administration's support) is likely to remain in effect.

So what would a new, Trumpian U.S. NDC look like?

At a minimum, any Trump NDC would need to acknowledge that the U.S. is altering its central components. And presumably, any new NDC would need to lower the overall U.S. commitment substantially: if Trump succeeds in dismantling the Obama climate programs, we would achieve [emissions reductions](#) far lower than the 26-28 percent by 2025 than we have committed to. A new report [predicts](#) that U.S. emissions would flatten rather than decline.

That raises a legal question under the Paris Agreement: can a country weaken its commitment rather than strengthening it? Article 4.11 of the agreement says that a party "may at any time adjust its existing [NDC] with a view to enhancing its level of ambition...." Architects of [the language](#) say that it encourages more ambitious language but does not require it. Others, including EPA Administrator Scott Pruitt and the Competitive Enterprise Institute, [argue](#) that the language is meant to prevent backsliding.

Perhaps more important than the language about NDCs is the fact that the Paris Agreement contains no mechanism to punish a wayward party. In other words, even if the U.S. were to submit a weaker NDC, the Paris Agreement includes no means to sanction the Trump Administration. Most legal analysts have also [concluded](#) that if the U.S. remains in the Agreement, its participation is unlikely to have any legal bearing on any domestic lawsuits involving the Trump Administration's efforts to roll back the Obama programs that make up our NDC.

Formally, though, while it's true that the agreement has no enforcement mechanism that would penalize the U.S. for lowering its commitment, it nevertheless has an "implementation and compliance mechanism." Article XV, paragraph 1 first establishes "a mechanism to facilitate implementation of and promote compliance with the provisions of"

the Agreement. Article XV, paragraph 2 of the agreement further explains,

The mechanism referred to in paragraph 1 of this Article shall consist of a committee that shall be expert-based and facilitative in nature and function in a manner that is transparent, non-adversarial and non-punitive. The committee shall pay particular attention to the respective national capabilities and circumstances of Parties.

Would a weaker U.S. submission be viewed as something an Article XV committee should try to address “in a manner that is transparent, non-adversarial and non-punitive?” Given that the U.S. has significant national capabilities, perhaps so. It’s interesting to imagine what such a committee meeting might look like. The bottom line, though, is that the worst that the Trump Administration could expect if it submitted a weaker NDC is a “transparent, non-adversarial and non-punitive” committee that would presumably work to facilitate a stronger U.S. contribution.

Substantively, the other big question is what a U.S. NDC would actually contain. The administration has two potential options.

The first path is to take the Paris Agreement’s purposes seriously and submit an NDC that makes the case that the U.S. will still achieve greenhouse gas emissions reductions of a certain percentage (lower than the current NDC) by 2025 levels. But doing so would commit the Administration publicly to a strategy – emissions reductions that reduce global warming – that to date it has disavowed. And would the Administration attempt to maximize the percentage reduction it can represent to the global community by, for example, relying on Obama-era regulations it hasn’t dismantled (energy efficiency standards for appliances, greenhouse gas standards for automobiles for 2018-21) and on aggressive actions states like those California and New York are taking to reduce their emissions? The irony is a bit much to contemplate.

Or does the Trump Administration instead simply submit language similar to what its representatives [apparently have been parroting](#) in global meetings when the issue of climate change is raised. Written comments submitted in last week’s Bonn climate talks consistently say something like the following: “The administration is reviewing existing

policies and regulations in the context of a focus on strengthening U.S. economic growth and promoting jobs for American workers, and will not support policies or regulations that have adverse effects on energy independence and U.S. competitiveness.”

Under either approach to the NDC process, the Trump Administration will be subject to global hand-wringing and criticism from allies and domestic political opponents for its weak response to global warming. But the criticism is likely to be far less withering than what Trump would face if he announced a U.S. withdrawal from the agreement. For that reason, my bet is that we’ll soon see an announcement that the U.S. will remain in the Paris Agreement. If we do, don’t celebrate.
