

The Santa Clara Valley Water District has created a [Climate Change Portal](#) on its website, compiling “reports and other technical literature on the subject of climate change” and how it could affect the District’s work. The reports can be browsed by topic or date. They include everything from hard-core science to legal analysis, and from local to global scope. No single site can keep up with all the information being generated about global warming and its consequences, but this site has a selection of documents deemed useful by those who have to deal with climate change professionally. Some of the commenters on Dan’s [Open Letter](#) to climate change deniers might want to spend some time with this material. (Hat tip: [AWRA Water Blog](#).)
