A spectacular and frightening graphic from Christina Larson over at James Fallows' *Atlantic* blog: Larson posts a photograph that allows you to compare a picture of Mount Everest from 1921 with one from today. Don't look if you don't want to see something sad; as Larson notes, the glacier atop Everest has lost 320 vertical feet of ice sheet in the last 90 years. Take a look.

But climate change isn't happening. Nope; not at all.
